FLORIDA VITAL STATISTICS 1979

I N T R O D U C T I O N

FOREWORD

This annual report summarizes data compiled from original birth, death, stillbirth, marriage, and dissolution (of marriage) records filed with the Office of Vital Statistics (VS) as required by law. Standard forms recommended by the U.S. Public Health Conference on Records and Statistics are used for certificates of birth, death, and fetal death (stillbirth).

Responsibility for filing birth certificates lies with physician, midwife, or other attendant. Undertakers, or persons acting as such, are legally charged with filing death and fetal death (of 20 or more weeks gestation) certificates. These are submitted to local registrars who in turn forward to VS. VS receives marriage and dissolution records directly from the various courts. Induced abortion reports are sent in directly by physicians, hospitals and clinics.

HISTORICAL BACKGROUND

This marks the 63rd year of statewide collection of birth and death records, begun in 1917. Florida was admitted to the Death Registration Area in 1919, and to the Birth Registration Area in 1924, by virtue of having met all U.S. Bureau of Census criteria. Marriage and dissolution records have been filed with VS since June 1927, abortion reports since April 1972.

RESIDENT AND RECORDED EVENTS

Births and deaths are tabulated according to both usual place of residence (events occurring to Florida residents regardless of place of occurrence) and place of occurrence (events occurring in Florida regardless of usual residence). The former are herein referred to as resident, the latter recorded, events. Resident data have been tabulated since 1933, the year in which interstate exchange of vital records began. Prior to 1933, only recorded data are available.

Varying interpretations of "usual residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations to some extent, since the residence stated on the certificate is normally accepted without question. Institutional deaths, wherever possible, are allocated to the county from which the person was admitted. For births and stillbirths, the mother's residence is used when it differs from the father's.

Marriage, dissolution and abortion data are by place of occurrence only; there is no interstate exchange of these records. However, Florida dissolutions of marriage are granted to legal residents only; so there can only be resident dissolutions.

CAUSE OF DEATH

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization and the National Center for Health Statistics (NCHS). Standardized codes are assigned from the International Classification of Diseases (ICD).

To keep abreast of changes in medical knowledge ICD is revised approximately every 10 years. Revisions and years used in Florida are:

Revision	Years Used	Revision	Years Used
Second	1917-1920	Sixth	1949-1957
Third	1921-1929	Seventh	1958-1967
Fourth	1930-1940	Eighth	1968-1978
Fifth	1941-1948	Ninth	1979-

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or the changes from one revision to another were minor.

The Ninth Revision contains major modifications of some sections, so that more deaths are now assigned to certain categories than would have been assigned under Eighth Revision rules, and vice versa. NCHS coded a sample of 1976 U.S. deaths by both Eighth and Ninth Revision rules. The results were grouped by major causes, and for each of these, the number of Ninth Revision deaths was divided by the number of Eighth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Suicide is 1.0032; this implies that Ninth Revision coding of a given set of death certificates will produce about 32/100ths of one percent more Suicides than would Eighth Revision rules.

National comparability ratios are shown in Table M for Florida's leading causes of death. When comparing deaths from these causes for 1979 or later to those for 1968-78, the ratio multiplied by the earlier data (either number of deaths or death rate) will yield an approximation of the data which would have resulted under Ninth Revision rules.

AVAILABILITY OF DATA

In addition to data presented here, much greater detail is available from unpublished tables upon request. Also special statistical tapes and tables may be requested on a fee-for-service basis. Information concerning data available from these sources may be obtained from Public Health Statistics Section, P.O. Box 210, Jacksonville, Fla. 32231 Phone (904) 354-3961, or SUNCOM 673-3180.

RACE

Race is usually counted as it is stated on birth, death and marriage certificates, with such designations as "Hispanic" counted as white. For births, the child is counted as white if both parents are white, or if one is white and the other unknown or not stated; the child is counted as nonwhite in all other cases where the race of at least one parent is known; the race is left as unknown or not stated only when both parents are unknown. Specific nonwhite races are assigned according to a somewhat complex coding procedure, copies of which are available on request. The 1970 U.S. Census for Florida showed a population that was 15.3 percent black and less than 0.4 percent other nonwhite races.

UNKNOWNS

Tabular totals in this publication may include some records of unknown age, race or sex. In these cases the components shown will not add to the total.

COMPLETENESS OF DATA

Tabulation of data for this annual report was begun after allowing a reasonable time for receipt of late records. A few certificates were received after tabulation and are not included in this report. These records represent only a small fraction of the total, and their omission does not materially alter the facts presented.

ACKNOWLEDGEMENT

Basic tabulations for this report were prepared by the Office of Management Systems, and we gratefully acknowledge the able assistance of Mr. M. E. Gardner, Jr., Information Systems Supervisor.

POPULATION

At midyear 1979 Florida's population had increased by an average of 3.4 percent annually since 1970. This is about six percent higher than the growth rate during the previous (1960-70) decade but 42 percent lower than the 1950-60 rate (Table A).

The annual average numerical increase of 271,156 includes a natural increase (excess of resident births over resident deaths) of 23,671 leaving an estimated net in-migration of 247,485 ... or 20,624 per month. This compares with a monthly in-migration of 13,564 in the 1950-60 decade and 11,317 in the 1960-70 decade.

The nonwhite population had dropped to 13.2 percent of the total by 1979, about the same as U.S. percentage. The 65-and-over population was at 17.7 percent, far above the U.S. 1978 figure of 11.0 percent. The under-15 group was down to 20.4 percent in Florida vs. a U.S. 1978 proportion of 23.3 percent.

Midyear population estimates are based on April 1 estimates prepared by the Bureau of Economic and Business Research, University of Florida.

GENERAL NATALITY

Florida's resident live births reached all-time highs in 1979 for both race groups. The numerical increases were 6,408 for whites and 1,370 for nonwhites; the rate increases were 3.8 percent for whites and 3.1 percent for nonwhites. The new rate of 11.0 per 1000 population for whites is the highest since 1974, and the rate of 26.5 for nonwhites is the highest since 1971. The rate for nonwhites continues to be about 2.4 times the rate for whites.

Table B

RESIDENT LIVE BIRTHS AND RATES PER 1000 POPULATION BY RACE, FLORIDA, 1950, 1960 AND 1969-1979

YEAR	BIRTHS			RATES		
	TOTAL	WHITE	NON-WHITE	TOTAL	WHITE	NON-WHITE

1978	113,367	82,304	31,033	12.6	10.6	25.7
1979	121,145	88,712	32,403	13.0	11.0	26.5

FERTILITY

The general fertility rate increased from 62.8 to 64.7 per 1000 women aged 15-44, up 3.0 percent. The increase for whites was 3.3 percent - for nonwhites 2.7 percent. The rate for nonwhites remained about double the rate for whites.

Among white women, age-specific birth rates increased for the four age groups between twenty and forty. Teenagers and women forty and over had slightly lower birth rates than in 1978. The greatest proportional increase was in the 30-34 age group which rose by 9.4 percent. Median age of white mothers reached its highest point since 1958 at 25.1 years.

Among nonwhite women, age-specific birth rates increased for all age groups. The greatest proportional increase of any significance was in the 25-29 age group which rose by 10.1 percent. Median age of nonwhite mothers reached its highest point since 1967 at 22.8 years.

Table C

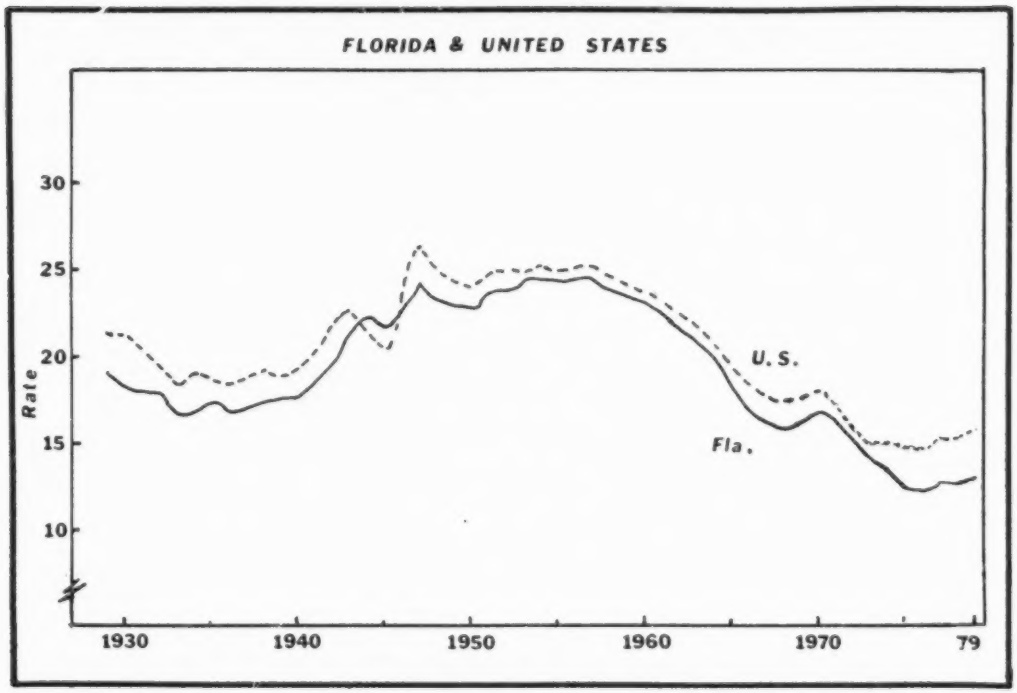
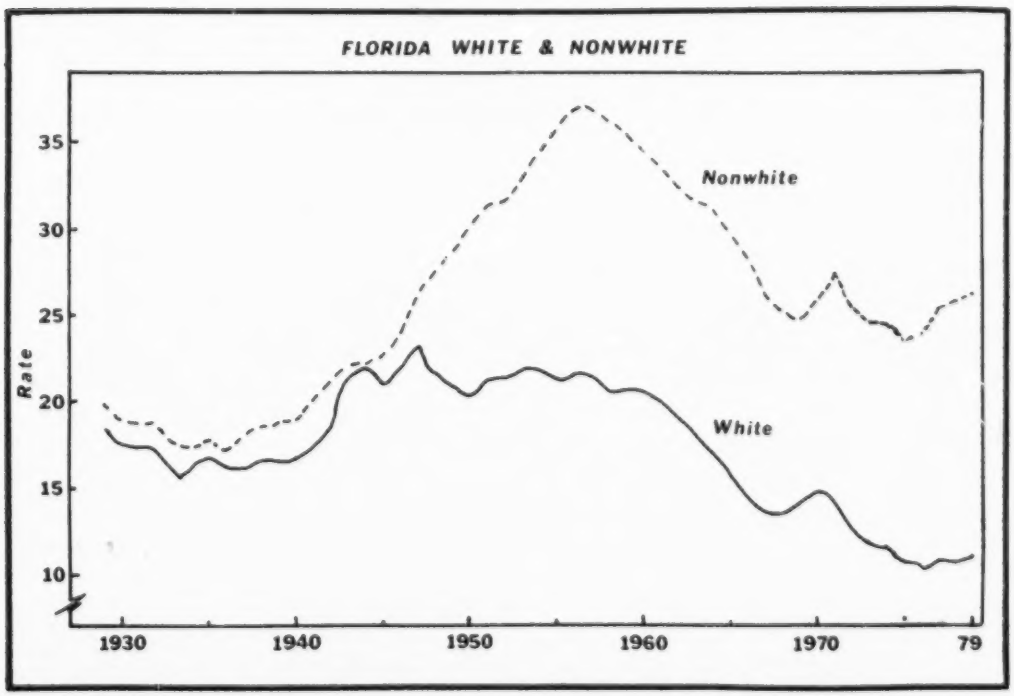
Figure 2

RESIDENT BIRTH RATES PER 1000 POPULATION 1930-1979





BIRTH ATTENDANTS

By 1965 99.3 percent of white births were in hospital, and nonwhite births were approaching the same high proportions. Maternal and perinatal mortality had been reduced by general advances in medical knowledge, increasing proportions of deliveries by physicians, training and licensing of midwives.

Certified Nurse-Midwife deliveries are now increasing for both race groups as indicated by the increases for total midwife deliveries to 3.! percent among whites and and 6.5 percent among nonwhites.

The large increase in the "all other" category during 1977 suggests more unlicensed deliveries. However, there were some reporting problems in that year, and those problems may have affected the data. More recent 1978 and 1979 data indicate that there really is an increase in this category.

LOW-WEIGHT BIRTHS

Birthweights of 2500 grams (5 1/2 lbs.) or less are arbitrarily called low-weight. There are inherent normal differences in birthweight distribution between sexes. Females generally weigh less but have lower infant mortality. On the other hand, studies have shown that the risk of neonatal mortality is much higher for low-weight births than it is for "normal" weights. Table E shows that proportions of low-weight births in Florida have declined over the past decade.

Table E

*2500 grams (5 1/2 lbs.) or less

BIRTHS TO UNWED MOTHERS

In the decade since 1969 the percentage of white mothers who were unmarried has grown from 6.5 to 9.8, but these percentages are still quite small in comparison with those for nonwhites: from 38.7 to 57.0 in the same period. Since 1973 more than half of all nonwhite mothers have been unmarried (Tables F and G, Figure 3).

INDUCED ABORTIONS

Induced abortions have been legal in Florida since April, 1972. The 1979 pregnancy rate among females of childbearing age was up to 9.5 percent, and the induced abortion ratio was 31.5 per 100 pregnancies.

Table H

FETAL DEATHS (STILLBIRTHS) 20 WEEKS

In Florida, a fetal death certificate is required when the gestation period is 20 or more weeks. These deaths usually result from "spontaneous", i.e., not induced, abortions. Thus the probability that a given event would be included in both statistical entities, Induced Abortions and Fetal Deaths, is extremely low.

The fetal death ratio per 1000 live births reached a record low in 1979, despite a slight increase in the ratio for nonwhites (Table I, Figure 4).

Table I

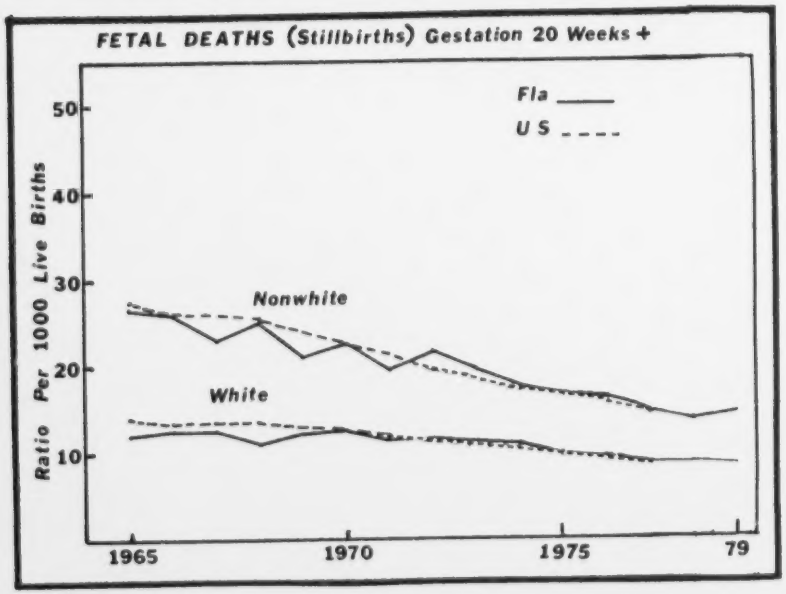
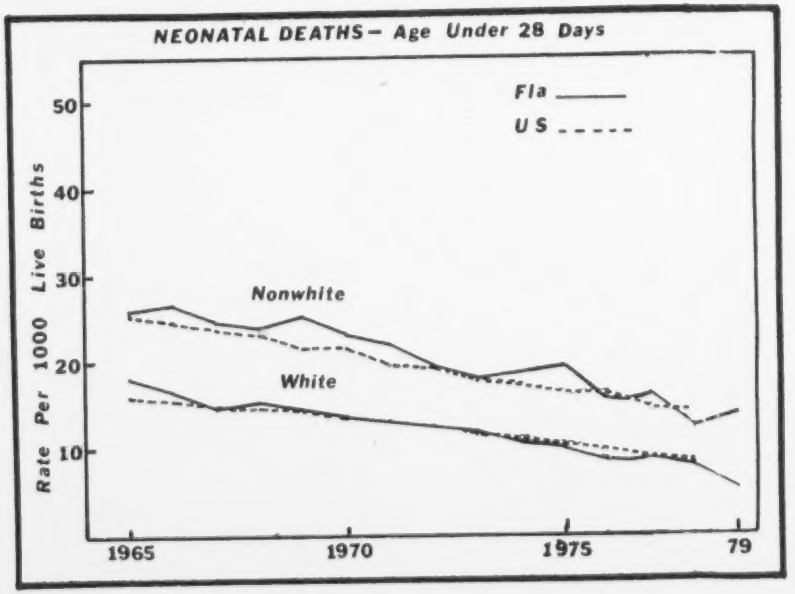
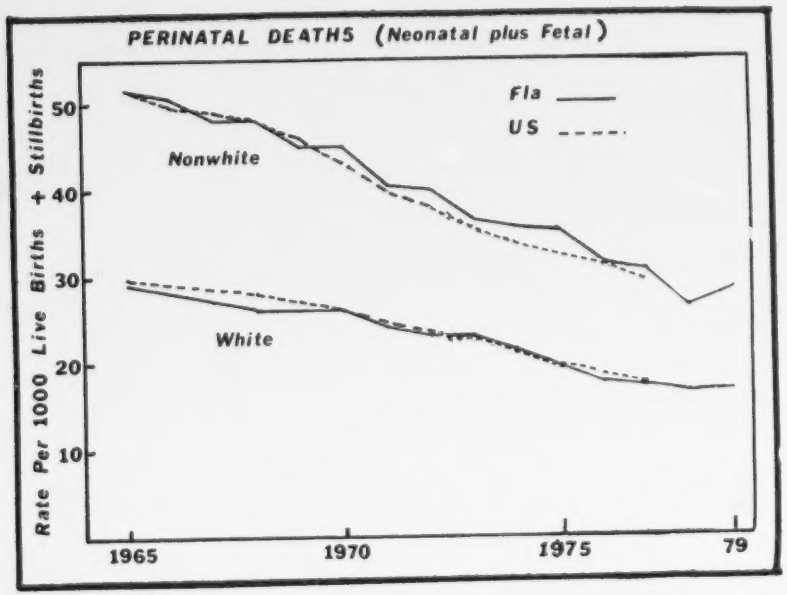
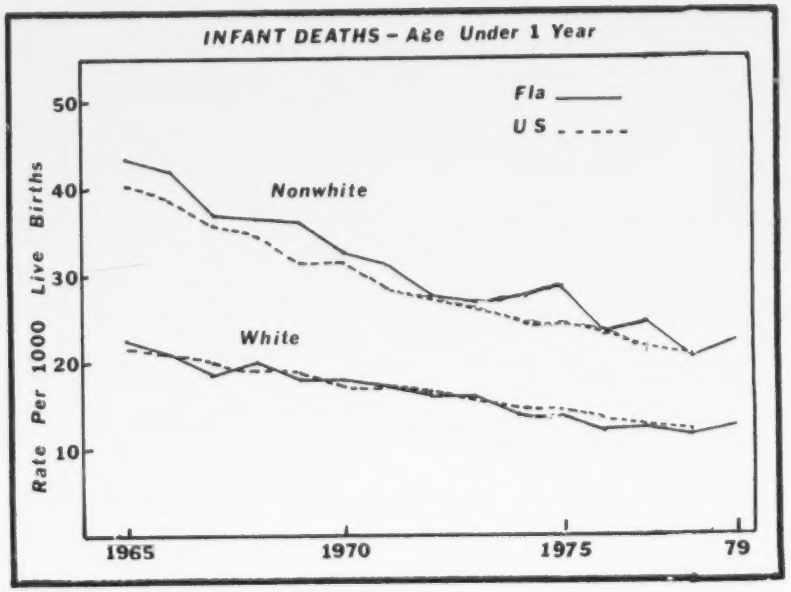
Figure 4

RESIDENT FETAL, NEONATAL, PERINATAL, & INFANT MORTALITY BY RACE; FLA. & U.S., 1965-79









GENERAL MORTALITY

Florida's resident deaths for 1979 exceeded 98,000 for the first time, but the rate remained at 10.6 per 1000 population. Although the general trend in the state's mortality had been upward since 1950 due to immigration of retirees, the rate dropped after 1973. Since 1976 it appears to be climbing again (Table L, Figure 5). In 1979 the rate for whites dropped to 10.8, while the rate for nonwhites rose to 9.2 per 1000.

Age-adjusted death rates reached new lows at 5.6 overall and 5.2 for whites, while the rate for nonwhites was unchanged at 9.2 per 1000. These rates imply that, if age distributions were the same as a standard population for both race groups and remained constant from year to year, (1) nonwhites would have higher death rates than whites, 9.2 vs. 5.2 per 1000 in 1979, (2) mortality would have shown a decline for both groups since 1950, and (3) Florida would have a slightly lower death rate than the U.S. as a whole. The U.S. age-adjusted rate for 1979 was 5.9 vs. 5.6 for Florida (Table L, Figure 5).

CAUSES OF DEATH

Table M shows Florida's leading causes of death for 1969 and 1979. Heart, Cancer, Stroke and Accidents continued as the top four, accounting for 71.3 percent of 1969 deaths and 74.4 percent of the 1979 total. Heart and Cancer rates increased, while Stroke and Accident rates decreased.

Chronic Obstructive Lung Disease (COLD) rose to fifth place, Pneumonia-Influenza dropped to sixth, Cirrhosis rose to seventh, Suicide rose to eighth, Diabetes remained ninth, and Atherosclerosis remained tenth. Perinatal Diseases dropped from seventh to twelfth, the greatest proportional change. Ratewise, three of these seven increased: COLD, Cirrhosis and Suicide; while the others declined.

Cause rankings were the same for whites except for Atherosclerosis and Diabetes which were the ninth and tenth causes respectively.

Cause rankings, except for the top four, were somewhat different for nonwhites. Homicide was the fifth cause of death, followed by Perinatal Conditions, Diabetes, Cirrhosis, Pneumonia-Influenza, with COLD tenth. Atherosclerosis was fourteenth and Suicide sixteenth for nonwhites.

HEART DISEASE

The unadjusted Heart Disease death rate rose in 1979, but it may be on a downward trend in spite of in-migration of 65-and-over population.

The age-adjusted rates for this cause indicate improvement over the past two decades. Heart Disease is still Florida's, and the nation's, leading cause of death, as it has been for more than 50 years. Differences between unadjusted rates for males and females are not due to age distribution; but between rates for whites and nonwhites, age distribution appears to be the primary factor, since there is a much higher proportion of older people among whites. The age-adjusted rates for nonwhites (not shown) are much higher than those for whites (Table N).

Ischemic (Atherosclerotic) Heart Disease was the cause of about 80 percent of these deaths among whites and about 59 percent among nonwhites (Table O).

CANCER (MALIGNANT NEOPLASMS)

Malignant Neoplasms have risen in death rate for 29 years, partly due to population aging. The age-adjusted rate showed a probable increasing trend even in a Florida population with stablized age distribution (Table P).

Males have higher Cancer death rates than females, and rates for whites are higher than for nonwhites, although the racial difference, again, is primarily attributable to the aging of the white population.

Five principal types of Cancer are those of the Digestive System, Respiratory System, Genital Organs, Breast and the Leukemias. Respiratory Cancer has far outstripped the others in rate of increase for the last 29 years, having more than quadrupled in rate, from 15.5 to 67.8 deaths per 100,000 population, and now exceeds the Digestive Cancer death rate, which rose only 44 percent (Table Q).

The Leukemia death rate nearly doubled in this period as did the rate for Breast Cancer, while Genital Cancer rose by only 7 percent.

The smaller increases in Genital, Breast, Digestive Cancer and Leukemia are probably a reflection of earlier detection and treatment methods, combined with intensive public education efforts, the Pap smear for female Genital Cancers, self-examination for Breast Cancers, and chemotherapy for Leukemias.

1979	241.9	65.3	67.8	27.3	18.5	8.6

STROKE (CEREBROVASCULAR DISEASE)

Stroke continued as the third leading cause of death, but both the crude and age-adjusted rates have declined for the past six years in a row (Table R).

Females have higher Stroke death rates than males, and whites have higher rates than nonwhites. Again, both of these differences are due to aging, since age-adjustment in both cases gives an opposite effect, i.e., males have higher age-adjusted Stroke death rates than females, and nonwhites have much higher age-adjusted rates than whites.

Table R

ACCIDENTS (BY PLACE OF ACCIDENT)

Accident mortality increased in 1979 both in number and rate, with the largest percentage increases among nonwhite females followed by white females, then white males. Only nonwhite males showed a slight decline.

Males have much higher accidental death rates than females, and nonwhite males have rates about one-third higher than white males. The male/female differences are even greater; for whites, the death rate among males is more than double the rate for females; for nonwhites, more than triple (Table S).

Deaths occurring to skin and scuba divers are not directly classifiable by ICDA codes. For this reason, and because of growing concern, a special record has been kept since 1960 of Florida deaths in connection with this increasingly popular, albeit dangerous, sport.

Table U shows 20-year results of the study. Of 462 deaths, 211 occurred in salt water (ocean, gulf, bay, river mouth) and 251 were in inland waters (sink hole, spring, lake, upriver, canal, rockpit, pool). Of the latter, 202 occurred in underwater cave explorations. Monroe, Dade, Broward, Pinellas, Palm Beach, Bay, Okaloosa and St. Lucie counties had a total of 202 deaths...most of the salt water group. Suwannee, Gilchrist, Volusia, Walton, Hernando, Holmes, Levy, Marion, Columbia and Jackson Counties had a combined 198...most of the fresh water deaths; the latter group of 10 counties also accounted for 176 of the 202 cave diving deaths.

439 of the victims were male, 431 white and eight nonwhite; the other 23 were white females. Median age was 23.0 years.

For the last eleven years of the study, 1969-1979, residence data show that 150 of 338 victims, or 44.4 percent, were from out of state. Among cave divers 83 of 143, or 58.0 percent, were nonresidents.

CHRONIC OBSTRUCTIVE LUNG DISEASE & ALLIED CONDITIONS

The cause group which included Bronchitis, Emphysema and Asthma has been expanded to include Bronchiectasis and the increasingly-used general term: Chronic Obstructive Lung Disease. These causes combined, and referred to as Chronic Obstructive Lung Disease & Allied Conditions, now constitute the fifth ranking cause of death.

This cause group is probably more directly related to cigarette smoking and/or air pollution than any other ... with the exception of lung cancer.

The death rate in 1979 for white males was about equal to the combined rates of the other three race-sex segments for this cause. The rate for white females has increased much more rapidly over the past decade, but all race-sex groups showed an increase.

Despite the overall increase in rates, however, the age-adjusted rate showed little change in this decade.

AA:age-adjusted to U.S. 1940 standard population

PNEUMONIA & INFLUENZA

Deaths from Pneumonia and Influenza ("Flu") are reported together because of the close relationship between the two causes. Although Flu deaths normally constitute a very small fraction of the total, there is usually a great increase in Pneumonia deaths during Flu epidemic years. There is little doubt that most of these excess Pneumonia deaths were originally Flu cases.

Florida's 1979 Pneumonia-flu death rate was down to 20.1 per 100,000 population, and the age-adjusted rate fell to 9.5 (Table W).

CHRONIC LIVER DISEASE & CIRRHOSIS

In 1979, 35 percent of the Chronic Liver Disease deaths were specified as associated with alcoholism; the rest had no mention of alcohol, but there is little doubt that many of these were also alcohol-related.

There was a slight increase in overall mortality for 1979, although the age-adjusted rate dropped for the third successive year.

Males have higher Cirrhosis death rates than females; this is true for all races and remains the case after age-adjustment. Racial differences, however, are strongly affected by age distribution. Table X shows quite similar rates for whites and nonwhites; but after age-adjustment the rate for nonwhite males is much higher than the rate for white males, and nonwhite females have a much higher rate than white females.

AA: age-adjusted to U.S. 1940 standard population

SUICIDE

Suicide, the eighth-ranked cause of death in 1979, showed a long-term increase in rate from 11.2 in 1950 to 17.8 in 1977 but has since decreased to 16.3, the lowest rate since 1972.

A higher proportion of widowed/separated/divorced persons, who are known to have high suicide rates, and of other displaced persons who have left their homes to come to Florida, probably accounts for much of the difference between the Florida and U.S. Suicide rates (16.3 vs. 12.6 in 1979).

Whites have much higher suicide rates than nonwhites, and males are higher than females in both race groups (Table Y).

DIABETES MELLITUS

Diabetes is another disease in which the death rate rises sharply with age, and this is the main reason for Florida's general increase in Diabetes death rate, which persisted until 1973. Since that time there has been a downtrend (Table Z).

After age-adjustment, nonwhite females have the highest mortality from Diabetes, and white females the lowest; nonwhite males have the second highest (about 2.7 times the white male rate).

Table Y

ATHEROSCLEROSIS

Atherosclerosis remained tenth among leading causes of death in 1979. This is primarily a disease of the aged. 96 percent of these deaths in 1979 were among persons 65 years of age and older.

Both deaths and rates increased in 1979 with only non-white males showing a decrease (Table AA).

TUBERCULOSIS

Once Florida's leading cause of death (1917), Tuberculosis now ranks about thirty-first among major cause groups. The general trend since 1950 has been downward (Table BB).

Table BB

LEADING CAUSES BY AGE (TABLE CC)

INFANTS (Under 1 Year)

The infant death rate per 100,000 infant population* dropped about 32 percent from 1969 to 1979. Although considerably reduced in rate, 1969's three leading causes of infant death would have retained their rankings, had it not been for the newly-indentifiable Sudden Infant Death Syndrome, which was not classified as a distinct entity until 1974. This primarily post-neonatal condition now ranks third among all infant death causes. Pneumonia-Influenza and Accidents ranked fourth and fifth in 1979, and both showed rate decreases.

1 - 4 AGE GROUP

There was a 35 percent drop in the overall death rate for the 1-4 age group. Accidents remained first, followed by Congenital Anomalies, Cancer and Meningitis, all of which dropped in rate. Homicide rose to fifth place, accompanied by a large increase in rate. Pneumonia-Influenza tied for second place in 1969, and Meningococcal Infection, fifth, dropped out of the top five in 1979.

5 - 14 AGE GROUP

The overall death rate for the 5-14 age group fell 32 percent during the period 1969-1979. The first three causes were unchanged in rank, and rates (except for Cancer) were lower. Homicide rose to fourth and Heart Disease to fifth. Although not shown in Table CC, the fourth ranking cause in 1969 was Pneumonia-Influenza.

15 - 24 AGE GROUP

An overall decrease in death rate of only one percent occurred to Florida's young adults during the decade. Accidents remained as the leading cause of death, with Homicide second and Suicide third. Cancer and Heart Disease were fourth and fifth respectively. Homicide, Suicide and Cancer had rate increases; Accident and Heart Disease rates declined. Pneumonia-Influenza dropped out of the top five.

25 - 44 AGE GROUP

This age group had an overall decrease in death rate of about 23 percent. The five leading causes were the same five causes, but Heart Disease dropped to fourth in rank. Cancer and Homicide rose to second and third while Suicide remained in fifth position. The Suicide death rate increased while the other four decreased.

45 - 64 AGE GROUP

This age group also had an overall decrease in death rate, about 22 percent. The same five causes of death were at the top, but Cirrhosis rose to fourth, swapping places with Accident. Of these five leading causes, only Cancer showed a rate increase.

65-AND-OVER AGE GROUP

The overall death rate was down about 12 percent for the oldest age group, with Heart Disease, Cancer and Stroke retaining their rankings. The Cancer death rate rose about 15 percent, and the new grouping called Chronic Obstructive Lung Disease & Allied Conditions rose about 27 percent above its 1969 rate, pushing it into fourth place ahead of Pneumonia-Influenza.

*not to be confused with the infant mortality rate shown on page 8

MATERNAL MORTALITY

Florida's maternal mortality remained low in 1979 despite a rate increase among nonwhite mothers. This increase for nonwhites, since it is based on a very small number of deaths, is probably not significant to the long-term downtrend in this rate.

Table DD

RESIDENT MATERNAL DEATHS AND MATERNAL MORTALITY RATES PER 10,000 LIVE BIRTHS, BY RACE, FLORIDA, 1950, 1960 AND 1969-1979

MARRIAGES AND DISSOLUTIONS

The number of marriages in Florida reached an all-time high in 1979, and the marriage rate rose to 11.1 per 1000 population, well below the 1973 peak year.

Dissolutions of marriage (including annulments) also reached an all-time high and rose in rate to 7.5, thus equalling the 1975 peak.

Many of Florida's dissolutions are granted to persons who establish residency in the state specifically for this purpose; these cases account for most of the difference between the Florida and U.S. dissolution rates, as well as for the high ratio of dissolutions per 100 marriages in Florida, now at 67.5, compared to only 50.7 nationally. This ratio has dropped in Florida for four consecutive years, and as other states become more liberal in their divorce laws, the difference between Florida and the nation will continue to lessen (Table EE, Figure 6).

Table EE

LIFE EXPECTANCY

Life expectancy at birth has increased about 2.9 years for white males and 2.1 for white females in the eight years since 1970, while it has increased by about 2.9 years for nonwhite males and 4.5 for nonwhite females. White females continue to have a much greater expectancy, 78.9 years, than any other population segment, followed by nonwhite females at 72.4 years, white males at 71.3 years, and nonwhite males at 62.2 years. Data for 1979 were not available at press time (Table FF).
